Version 1 Features

The guiding idea for V1: include what's needed to deliver your core promise, less time organizing, more time learning, and nothing that delays launch.

1. **Assignment Organizer**
   This is the foundation of the app. The scheduler can't work without assignment and due-date data, so it has to come first. It also solves the most basic problem in your description (losing track of work) and gives students a reason to open the app daily.

2. **AI Study Scheduler**
   This is your signature feature and the clearest answer to procrastination and poor time management. Without it, the app is just a to-do list, and plenty of those already exist. It depends on the Organizer, so the two should launch together.

3. **Assignment Breakdown into Smaller Steps**
   Your description names "not knowing where to start" as a core problem, and this directly addresses it. It's also relatively light to build, since it's one AI prompt applied to an assignment the student already entered, and it delivers a lot of perceived value.

4. **AI Flashcard Maker**
   This is the most concrete time-saver. Students immediately see the value (paste notes, get flashcards), and it has a simple input-output flow, which makes it low risk to build well.

5. **AI Quiz Generator (with explanations)**
   Flashcards and quizzes use the same underlying capability (turning notes into study material), so building them together is efficient. Quizzes with explanations also support learning from mistakes, which strengthens the "study more effectively" half of your promise.

6. **Basic Reminders/Notifications**
   Not listed in your document, but I'd treat it as essential. A schedule only reduces procrastination if students are nudged to follow it. Keep it simple: due-date and study-session reminders.

Each feature will allow to optimize and make students time more efficient by making testing and study material to scheduling and reminding the student on important assignments.

Future Features

1. **AI Study Buddy (chat)**
   This feature is appealing but the most open-ended, and open-ended AI chat carries the most risk: inaccurate answers, off-topic use, and age-appropriate content concerns, especially since your users include minors. Launching it later lets you learn from how students use the V1 features first, and add proper safeguards. If you want a taste of it in V1, a limited version, such as “explain this flashcard” or “explain this quiz answer,” gives you the value with less risk.

2. **Progress Tracking and Streaks**
   These need real usage data to be meaningful, and they work best once students have built habits. They’d boost retention, but they’re not required to prove the core concept.

3. **Calendar Sync (Google/Apple/school calendars)**
   Very useful, but integrations take time and maintenance. Students can enter data manually at first, and you’ll learn from them which integrations matter most.

4. **Smarter Personalization**
   Examples include adjusting schedules based on missed sessions, spaced repetition for flashcards, or identifying weak topics from quiz results. This requires usage history to work well, so it naturally follows launch.

5. **Importing Notes from Photos/Files/Documents**
   Letting students snap a photo of handwritten notes or upload a PDF is a big convenience upgrade. In V1, typing or pasting notes is enough to validate the flashcard and quiz features.

6. **Learning Management System Integration (Canvas, Google Classroom)**
   This could auto-import assignments, which would be a major selling point, but it involves partnerships, permissions, and privacy requirements that would slow a first release.

7. **Collaboration and Sharing**
   Study groups, shared flashcard decks, and parent or teacher views are nice extras, but they add accounts, permissions, and moderation complexity. They don’t support the core “personal study partner” idea you started with.

8. **Gamification (rewards, badges, focus timers)**
   Good for engagement, but it’s polish rather than substance. Add it once you know the core features are working.
